2 The **okithm** Package

2.1 Theorems

If the language is set to Japanese like by `\usepackage[main = japanese]{babel}`, okithm will translate all the environment titles (Theorem, Definition, etc.) into Japanese. You can disable theorems by giving the option `notheorem` to okicmd.

```
1  \begin{theorem}[Awesome theorem]
2    The square root $\sqrt{2}$ of two is irrational.
3  \end{theorem}
4
5  \begin{definition}[Coprime]
6    Integers $a$ and $b$ are said to be \emph{coprime} if their greatest common
     divisor is one.
7  \end{definition}
8
9  \begin{lemma}
10   If $a$ and $b$ are coprime, so are $a^2$ and $b^2$.
11 \end{lemma}
12
13 \begin{proposition}
14   If $\sqrt{2} = a/b$, then $a^2 = 2b^2$.
15 \end{proposition}
16
17 \begin{corollary}
18   If $\sqrt{2} = a/b$ with $a$ and $b$ being coprime, then $a$ is even.
19 \end{corollary}
20
21 \begin{example}
22   If $a = 2$ and $b = 1$, then $a$ is even but $\sqrt{2} \ne a/b$.
23 \end{example}
24
25 \begin{remark}
26   Note that $a$ and $b$ must be integers.
27 \end{remark}
28
29 \begin{proof}[of Awesome theorem]
30   Suppose to the contrary that $\sqrt{2} = a/b$ with coprime $a$ and $b$.
31   Then both $a$ and $b$ are even, which contradicts the assumption.
32 \end{proof}
```

Theorem 2.1 (Awesome theorem). *The square root $\sqrt{2}$ of two is irrational.*

Definition 2.2 (Coprime). Integers a and b are said to be *coprime* if their greatest common divisor is one.

Lemma 2.3. *If a and b are coprime, so are a^2 and b^2.*

Proposition 2.4. *If $\sqrt{2} = a/b$, then $a^2 = 2b^2$.*

Corollary 2.5. *If $\sqrt{2} = a/b$ with a and b being coprime, then a is even.*

Example 2.6. If $a = 2$ and $b = 1$, then a is even but $\sqrt{2} \neq a/b$. □

Remark 2.7. Note that a and b must be integers.

Proof (of Awesome theorem). Suppose to the contrary that $\sqrt{2} = a/b$ with coprime a and b. Then both a and b are even, which contradicts the assumption. □

2.2 Algorithms

You can disable algorithms by setting the option `noalgorithm`.

```
1 \begin{algorithmic}[1]
2   \Input{$n \in \setN$}
3   \Output{$n(n+1)/2$}
4   \State{$s \gets 0$}
5   \ForTo{$i = 1$}{$n$}
6   \State{$s \gets s + i$}
7   \EndFor
8   \State{\Return $s$}
9 \end{algorithmic}
```

Input : $n \in \mathbb{N}$
Output: $n(n + 1)/2$
 1: $s \leftarrow 0$
 2: **for** $i = 1$ **to** n **do**
 3:     $s \leftarrow s + i$
 4: **return** s

2.3 Optimization Problems

You can change `minimize`, `maximize` and `subject to` into `min`, `max` and `s.t.`, respectively, by setting the option `optstyle` = short.
